While the core software of AutoCAD is continually evolving and is used in many industries for various purposes, this article will focus solely on AutoCAD and its features related to the architectural industry. Projects and Construction Documents Any professionally built structure is either a project or a construction document. Project is any built structure that is either under construction, under construction or complete. Construction document is a set of plans or specifications (written or electronic) intended to describe the design of a specific building, such as a house, a church, or a skyscraper. A construction document is produced by a professional architectural firm or civil engineer, but it may be done by a small general contractor or self-employed architect. Construction documents are typically used for new construction. Buildings are designed by architects or civil engineers who must comply with the Uniform Building Code or a separate local building code. Architects must complete a project as per standard industry rules and regulations. They must be competent in the structural, plumbing, electrical, fire safety and other requirements of their profession. These standard guidelines are called the AIA code.

Some local communities have adopted their own building codes that are not always completely identical to the national building codes. An architect will draw up the design of a building, usually in the form of a set of plans or a set of drawings. These drawings are then reviewed by the client, a general contractor or a design engineer, who may make

changes to the drawings or write an addition to them. Construction documents, when printed, are called construction drawings. A set of plans refers to a complete set of drawings, whereas a set of specifications is a smaller set of drawings describing only certain sections of the structure. Building inspectors check construction documents and the workmanship before a building is handed over to the owner. Once the work has been completed and the building is handed over to the owner, the building will be inspected by the local authorities, who will either give or withhold building permits. The owner may choose to hire a professional building inspector, who will then inspect the building at regular intervals to ensure that the structure meets the building code. Building permits are specific documents that are issued for a specific building. Types of projects Different types of building projects fall under different categories. Designing

The HLA DRw6 epitope is encoded within the DR beta chain gene and constitutes a high-risk haplotype for type 1 diabetes mellitus. In this study, the DR beta 1 chain gene and the DQ beta 1 and DQ beta 2 chain genes from patients with type 1 diabetes were analyzed to determine their HLA-DR beta 1, DQ beta 1 and DQ beta 2 gene polymorphism in an attempt to establish a profile of the Mexican population. Two groups of type 1 diabetic patients were studied, one group of 24 with retinopathy (DRw6+) and another group of 44 without retinopathy (DRw6-). Forty healthy unrelated controls were also included. Genomic DNA was extracted from blood leukocytes, and the HLA-DR, DQ and DQB gene regions were amplified by polymerase chain reaction and then analyzed by restriction fragment length polymorphism. DRw6 was present in 19.4% of the patients with diabetes ($p = 0.023$), but not in the controls. We also observed an association of DRw6 with an earlier age of disease onset (p “The American people are hurting right now, and in times like these, we should be better than our president. Show the current markup mode on the status bar. The button will change to inform you of the mode you are in. Markup Assist offers an assist mode that enables you to quickly create lines by drawing a small rectangle and then dragging one or more vertices on the line. Graphics Windows: Draw and export custom shapes. Use the new graphics windows

to create shapes that you can then insert into drawings. Export symbols and paths that you can import directly into AutoCAD. You can also create a catalog of symbols, which can be used to import them later. Rapidly export paths and shapes for future drawing projects. Export in PDF or SVG formats for SVG. Export to external file formats that are supported by AutoCAD, like BMP and TIFF. Grow, shrink, and recolor layers. You can now grow, shrink, and recolor layers to a custom size. Layered Layers: Layers now can be arranged in an order from back to front. Double click on a layer to open it in its own window and turn off the other layer windows. Layers can now be organized by name and category. You can save and restore closed windows. Import: Shapefiles (DWG) can now be imported into a drawing from Microsoft Excel and other file formats. CAD data files (DWG, DXF, DGN) can now be imported from Microsoft Excel and other file formats. Export settings, page setup, and layer visibility settings can be exported and imported. Symbols: Symbol sets can now be imported into a drawing from Microsoft Excel and other file formats. Importing and updating existing symbols from a repository: AutoCAD now checks if a symbol set is present in the repository before displaying the Importing and Updating dialog. Automatic update of linked files when symbols are changed in the repository. Importing a symbol set: You can now choose the symbol set for importing in the Import symbol dialog. You can now import symbol sets by name. This is useful when importing symbols that you have created in an external repository. Export symbols: You can now create symbols that you can use to export to external files, such as.CAT files or.XML files. The exported files can then be imported into another drawing using the Import external file command.
