The present invention relates to a core for a steel reinforcement bar, such as a steel fiber rope, steel cord, steel plate, or the like, which comprises at least one kind of alloy which is superior in mechanical strength, ductility and toughness, and a method of producing the same. The term "reinforcement bar" as used herein refers to, for example, steel fiber ropes, steel cords, steel plates, steel wires, or the like for reinforcing concrete or asphalt. Such a conventional steel reinforcement bar generally comprises at least one kind of alloy consisting essentially of, by weight, 5 to 15% of C, 1 to 10% of Si, 0.5 to 10% of Al, 0.5 to 5% of Mn, and 0.5 to 5% of Cr. In recent years, owing to their high mechanical strength and deformation characteristics, steel reinforcement bars made of such an alloy have been gradually in demand for various new purposes and applications. For example, reinforcement bars made of the above-mentioned alloy, in particular those used in the form of steel fiber ropes, steel cords or steel plates, are increasingly demanded to have the properties and performances in both tensile strength and ductility as high as those exhibited by conventional reinforcement bars for reinforcing concrete and asphalt, which employ a mild steel containing the same amount or more of C. However, it is very difficult to maintain the characteristics of conventional reinforcement bars even b7e8fdf5c8
