LEGO.Marvel.Super.Heroes.2.Update.v1.0.0.13948.incl.DLC-CODEX Fitgirl Repack

As the value and use of information continues to increase, individuals and businesses seek additional ways to process and store information. One option available to users is information handling systems. An information handling system generally processes, compiles, stores, and/or communicates information or data for business, personal, or other purposes thereby allowing users to take advantage of the value of the information. Because technology and information handling needs and requirements vary between different users or applications, information handling systems may also vary regarding what information is handled, how the information is handled, how much information is processed, stored, or communicated, and how quickly and efficiently the information may be processed, stored, or communicated. The variations in information handling systems allow for information handling systems to be general or configured for a specific user or specific use such as financial transaction processing, airline reservations, enterprise data storage, or global communications. In addition, information handling systems may include a variety of hardware and software components that may be configured to process, store, and communicate information and may include one or more computer systems, data storage systems, and networking systems. Oftentimes, electronic devices, including portable information handling systems (e.g., tablets, mobile phones, and personal digital assistants), include liquid crystal displays (LCDs) that are used to present visual information to a user of the electronic device. Liquid crystal displays typically include a display surface that is backlit with a light source in order to produce visible images on the display surface. The amount of light generated by the light source may be controlled using an array of light modulating elements. The individual light modulating elements within the array are addressed (e.g., selectively activated) in order to define a desired visual image on the display surface. However, in some configurations, certain types of electronic devices may not be able to efficiently use the amount of power that is provided to the light source. For example, the light source may be a backlight that is configured to illuminate a display surface of an electronic device. However, it may be desirable to reduce the power usage of the light source in order to extend the duration of time between light source recharging or replacement. Reducing the power usage of the light source may also reduce the intensity of the light generated by the light source, which may result in undesirable visual quality on the display surface of the electronic device. One solution to the limitations of reducing power usage within the light source of an electronic device has been to employ light-emitting diodes (LEDs) as light sources in place of
