"Among new areas that should be explored are the role of hemispheric asymmetries in the generation of the high degrees of independent and correlated variation that characterize normal brain functioning, [and] the role of reward and emotion as modulators of the basic brain mechanisms involved." "We have nearly 150 years of working with primates, and no one has been able to do what we have accomplished, in terms of advanced analytic methods, large numbers of subjects and cognitive tasks, not to mention the high quality behavioral and physiological recording technology," said Fincham. A critical issue is that compared to other species, the average number of neurons in humans is exponentially greater than in nonhuman primates, making them very powerful tools for in-depth analysis. The scientists suggest that these new tools could provide detailed insights into basic brain processes, such as critical periods in brain development, the influence of culture, as well as helping us to understand diseases affecting the brain.
