При всей каричнине
написал вот такой
вариант: `def all_pairs(root,
k): return [root,
all_pairs(root.left, k) +

Q: Determine if optional
argument can be passed to
function I've recently noticed
that in scala I can not
determine if the arguments

of a function can be passed or not. My code:

```
def myFunction(a:Option[Int])(implicit b:Boolean) { if(a.isDefined) if(b == true) { //something } else { //something else } else { //else something } }
```

How I'm calling the function:

```
myFunction(23)
```

`myFunction(23)` I expect both calls to work like the first one, but I got an

exception when I try to call it with the second argument. Is there any way to determine if the argument was passed or not? A: If the documentation says that it accepts an `Option[A]` and you pass in a `Some(x)`, then ... case `x => ...` is incorrect. What you are supposed to do is ... case `a => ...`
