Google's software When I was young, I loved to visit the library. I filled up my basket with books, puzzles, comics, and anything else I found interesting. Over the years, the library system I'm referring to faded away, and now I'm reading books online. You can download the free Google eBooks app on your phone and use it to read any books you might have bought in the past. It's been my experience that Kindle books don't look as good as books printed on paper, and I prefer the feel of print. Google eBooks is an obvious improvement over a downloaded ebook, and it works well with Kindle books if you have one of their readers. You can download the app to your computer and then use it to read books you've bought from Amazon. Another feature I use regularly is Google Drive. It is a simple way to store all your documents in one place for easy access. You can create new text documents and upload them to the cloud, create images and upload them to the cloud, and much more. I use Google Drive for office documents, research papers, and web design projects.

The main difference is that it lets users edit photos as opposed to creating or working with objects such as vector graphics, text, and shapes. Adobe Photoshop Elements also has lower memory and processor needs, and is cheaper. Plasmacytoid urothelial carcinoma of the bladder: distinctive immunohistochemical profile and favorable outcome of the disease. Plasmacytoid urothelial carcinoma (PUC) of the bladder is an uncommon urothelial malignancy that shows both carcinoma in situ and invasive components. The diagnosis of plasmacytoid urothelial carcinoma (PUC) of the bladder is difficult because the cytoplasmic features of plasmacytoid cells are often lost and are easily confused with those of benign plasma cells. PUC may also mimic reactive plasmacytosis of the bladder in light microscopy. Here, we investigated the clinicopathologic features and the prognosis of PUC. PUC was examined for the first time in Japan. A total of 41 patients, including 27 men and 14 women, were treated in our institution from 1999 to 2013. Thirty-two patients had prior history of bladder cancer and 9 patients had no history of bladder cancer. The median patient age was 72 years (range: 43-84). The median follow-up period was 50.6 months (range: 4.9-167.6). The bladder was the primary site in 29 patients, and other sites in 12 patients. According to the 2004 World Health Organization classification, 8 patients were classified as intermediate grade 1-2, and the remaining 33 patients were high-grade tumors (grade 3). Based on the 1979 tumor-node-metastasis classification, 15 patients were pTa, and 26 patients were pT1 or more. Treatment of PUC included transurethral resection alone in 5 patients and cystectomy alone in 6 patients. In addition, cystectomy was performed in 12 patients following recurrence of PUC, and transurethral resection or partial resection of the tumor in 24 patients with no residual tumor. Two patients with pT1 disease underwent primary radical cystectomy and adjuvant systemic chemotherapy. One patient with microscopic disease underwent transurethral resection alone. Nine patients with high-grade tumors received systemic chemotherapy. One patient with aggressive disease received alternative therapies, such as gemcitabine and carboplatin. The 3-year overall survival and disease-free survival rates were 98.8% and 82.5%, respectively, for all patients. Four patients with aggressive disease were alive with disease at 3 years after cystectomy. Our results showed that PUC can be successfully treated by

Q: Convergence of a sequence of eigenvalues of a normal operator Let  $(H, \langle \cdot, \cdot \rangle)$  be a separable Hilbert space and  $A \in \mathcal{B}(H)$  be a closed operator. Suppose that  $\lambda_1, \lambda_2, \dots$  are the eigenvalues of  $A$  and  $\mu_n = \lambda_n - A$  is the corresponding sequence of all non-eigenvalues of  $A$ . Is it true that  $\mu_n \rightarrow 0$  (with respect to the operator norm) if and only if  $\lambda_n \rightarrow \lambda$  and  $\lambda \in \sigma(A)$ ? I know that the eigenvalues of  $A$  converge to the corresponding eigenvalues of the adjoint operator  $A^*$  if  $\lambda_n \rightarrow \lambda$  and  $A$  is self-adjoint. However, I cannot see if the proof generalizes to the sequence of non-eigenvalues  $\mu_n$ . A: Here is a positive answer with some comments. Theorem: If  $A$  is a closed operator on  $H$  and  $B$  is the inverse of  $A$  (in the sense that  $A \circ B = I$ ), then  $\mu_n(B) = \frac{\lambda_n - A}{1 - \lambda_n \overline{\lambda}}$  where  $|1 - \lambda_n \overline{\lambda}| \neq 0$  (a simple calculation shows that this is true). Proof: Since  $D(B) = H$ ,  $\langle x, y \rangle - B(y) = 0 \iff (y - Bx) = 0$  and therefore  $\langle y - Bx, (y - Ax) \rangle = 0 \iff (1 - \lambda_n \overline{\lambda})x = \lambda_n(A - B)x = 0$ . Thus,  $\langle x, x \rangle - Bx = 0 \iff 1 - \lambda_n \overline{\lambda} = 0 \iff \frac{1 - \lambda_n \overline{\lambda}}{1 - \lambda_n \overline{\lambda}} = 0$ .
