KEYMACRO is an application that allows the user to define and save custom macro key sequences on the computer keyboard, in the same way Windows allows the user to define macros. KEYMACRO can be used to repeat actions faster, but its most important application is to perform functions that are not available in the standard Keyboard Shortcuts dialog box. What is a Macros? In a computer, macros are sequences of commands and keystrokes that can be automatically repeated by the computer itself. The most common use of macros is to perform repetitive tasks without the user having to open a dialog box or press a hotkey. Most computers have predefined macros, but you can also create your own macros in some applications. What is a Macros: In a computer, macros are sequences of commands and keystrokes that can be automatically repeated by the computer itself. Most computers have predefined macros, but you can also create your own macros in some applications. How to use it: To create a macro using KEYMACRO, you first need to define it. The macro definition window consists of two areas: The 'Macro Key' field is the hotkey that will be bound to the macro. The macro's action can be triggered by pressing this key. The macro can be triggered from within the application itself using the hotkey, but it can also be triggered from any Windows shortcut (e.g., the Windows Task Manager shortcut) or any third-party application such as Notepad. The 'Action' field contains the macro's command sequence. The macro is defined by entering the keystrokes into the text field and pressing the 'Ok' button. After completing the macro definition, the macro can be tested by pressing the hotkey associated with the macro and pressing the 'Run' button. ### What's New In?

System Volume Information Deleter is an application with a pretty suggestive name, providing a simple way to delete the 'System Volume Information' folder and thus free up a significant amount of occupied disk space. The above-mentioned directory is a hidden system folder that hosts data related to the created restore points, which help the computer go back to a previously functional state when you use this function. Due to the importance of the contained data, the directory cannot be deleted the regular way. System Volume Information Deleter works as a Windows service, so once the setup procedure is finished, you must start it in the 'Services' section or using the dedicated executable in the installation folder. What this application actually does is automatically delete the contents of the 'System Volume Information' directory each time a USB device is connected to the computer. Be advised that its actions result in the removal of important system files, so make sure that you know what you are doing. When too many entries are created in the 'System Volume Information' folder, your Windows drive will require a serious cleanup. Before using an application such as System Volume Information Deleter, you might consider avoiding such unpleasant situations by taking a few measures to preserve the computer's disk space. For instance, you can limit the maximum amount of storage space allocated to system protection, which means that older restore points are deleted as new ones are created. Periodically running 'Disk Cleanup' is also recommended.
