Most of the images in this book contain at least two layers, some with more than 100 layers. Generally, the image is in a single layers (mono). This gives you maximum control. You can move, stretch, and distort the image all within a single layer. Sometimes an entire page may have several layers that work together to complete a picture. Defining Layers Photoshop's layer system lets you organize all the image data on the page into layers. Each layer is made up of a base image and a collection of overlays that work with transparency. You can add or subtract layers to alter the picture. Because the entire project is stored in one layer, you can adjust your work any time. When you first open a file in Photoshop you see a set of thumbnail images at the top-left corner of the workspace window. These are your layers, containing the entire image, frame-by-frame. In the figure on the next page, the thumbnail on the left is a layer with all the pixels in the top area. The top image has the pixels in the middle of the layer, and the bottom image is one that has a layer containing the pixels in the bottom area. Photoshop gives you many ways to look at the layers that make up the image. Figure 2-4 shows one of Photoshop's main areas for working with layers. This is the Layers panel, and it houses a large number of layers. Click the thumbnail at the top to load the layers in the workspace. You can see the same layers represented in the workspace below the Layers panel. This figure shows three thumbnail images, each with a collection of layers. The top thumbnail is the entire image, the middle has a composite image containing the layers with their pixels in the middle area, and the bottom thumbnail shows a layer containing the pixels in the bottom area. **Figure 2-4** The Layers panel has three thumbnail images that can help you see how the layers are organized. What you see in the Layers panel depends on what type of files you have open in the workspace. A monochrome image, such as a photograph or a color image, has a single layers. A color image has three layers. In addition to the base layer, the composite layer, and the mask layer, the Layers panel also has a Smart Object, which is an object that acts like a layer but that you can manipulate just like a regular layer. Objective ===== The detection of *Borrelia burgdorferi* sensu lato (ssl) in blood and tissue from infected patients, and not only from serum as in most studies, might be useful for the design of new tools for early diagnosis of Lyme borreliosis. This study intends to investigate the presence and evolution of ssl specific antibodies in blood and tissues of infected patients using real time polymerase chain reaction (qPCR). Material and methods ===== Blood and tissues from *B. burgdorferi* sensu stricto (sss) and *B. afzelii* infected patients were obtained during different phases of the disease. All patients were followed-up for at least one year. The samples were collected either as venous blood or biopsies at the Instituto Nacional de Infectologia Evandro Chagas (IN) and the Centro Dermatologico Laetitia Wittkop from Hospital da Criança do RS. The following parameters were analysed: *Borrelia* ssl detection in tissues by using the E-G2[®] Assay (LG Life Science), qPCR for detecting and quantifying ssl DNA from blood and tissues (EQA: EUROIMMUN), and ELISA for measuring antibodies against the OspC OspA and IFA for antibodies against *B. burgdorferi* ssl, *B. afzelii* and *B. garinii*. Results ===== Out of the 26 patients studied, 19 were classified as having active disease based on skin manifestations, erythema migrans or other cutaneous manifestations. The sera of 7/19 patients (37.5%) were positive in the ELISA, while the sera of only 2/19 (10.5%) were positive in qPCR. The sera of 4/19 (21.1%) were positive in the IFA. In addition, the samples of 7/19 patients (42.8%) were positive by the PCR of the tissues. Conclusions ===== These results indicate that the presence of ssl specific DNA in blood and tissues is not correlated with the occurrence of cutaneous manifestations, serum IgM levels or the IFA against *B. burgdorferi* ssl, *B. afzelii* and *B. gar*
