Guides 1. Q: Java, adding a new String into the stack without using recursion? Im working on this very simple program where I have to write a method to add a String to the stack. The function's signature is void add(String s) and what I have to do is to write a method which does the exact same but this time, instead of writing "str", it writes "str". Lets say we have the following stack: String String The thing is, the number of Strings on the stack should always be odd. For example: String String String String String In this case the method should return true, but if the stack is like this: String String String String Then the method should return false. The same thing goes for the case where the stack is empty. Note that the stack is not writable and that the String s and the stack are completely separate, so I cant just declare a String s = Stack(); and I cant modify the Stack object because it's passed as a parameter to the method, which can only read its contents. So how can I write a function that does this? A: For the recursive case, a string of odd length of 's' will never end with a double dash. You can then test it after reading to see if the length matches: public boolean add(String s) { // If stack is empty, return false. if (stack.isEmpty()) { return false; } // If stack is full, return false. if (stack.size() == 1) { return false; } stack.push(s); int lastIndex = stack.size() - 1; return (stack.peek() != '-' && stack.
