Predominant in vivo use of intravenous (iv) fluids above room temperature usually requires additional supplementation of potassium chloride or sodium bicarbonate in the solutions to be effective. The risk of hypokalemia and hypo-osmolality, particularly at high temperatures or in patients with renal impairment, necessitates a detailed understanding of the thermodynamic stability of solution formulations. With no data available for these salts at temperatures above 25 °C, we investigated the osmolality-driven phase separation behavior of saline at temperatures ranging from 1 to 40 °C. The results indicate that the phase separation of these salt solutions occurs far below 25 °C and is predicted to occur more readily at elevated temperatures.4 Easy Ways to Grow Your Small Business Without a Website Your small business may not need a website, but it definitely needs to grow and survive without one.
