The procedure is performed by inserting a biopsy needle into the prostate gland, removing a small amount of tissue (biopsy), and inserting a thermo-ablator needle into the same position. Using a nearby rectal thermocouple as an internal temperature monitor, TRIMM delivers various controlled heat dose, duration and cycles to the biopsy site to kill the cancer cells without harming the surrounding healthy tissue. Several research institutions are conducting TRIMM research and have published their studies to date. Published findings suggest that TRIMM may improve disease-free survival. The validity of this claim has not yet been proven. The following research has been conducted: Among patients with cT2b-c (TNM stage IIA-IIIB) disease treated with radiotherapy (RT) or radical prostatectomy (RP), those receiving TRIMM had a significantly lower 10-year risk of recurrence (14.1% vs. 41.3%) compared with the non-TRIMM group. In addition, prostate-specific antigen (PSA) level
